John S. Coff, MD (2015) Petal SpineCare Waco, Texas, USA. The minimally invasive approach (MIS) is a surgical technique that uses a long, thin laparoscopic instrument to access the surgical site. This approach is used for a variety of spinal procedures, including discectomy, laminectomy, and fusion. The MIS approach is associated with less pain, less blood loss, and a faster recovery time compared to a traditional open approach. The MIS approach is also associated with a lower risk of infection and a lower risk of nerve damage.
